Assignment 7: GLMs week 2 (Linear Regression and beyond)

Rachel Landman

OVERVIEW

This exercise accompanies the lessons in Environmental Data Analytics on generalized linear models.

Directions

- 1. Change "Student Name" on line 3 (above) with your name.
- 2. Work through the steps, **creating code and output** that fulfill each instruction.
- 3. Be sure to **answer the questions** in this assignment document.
- 4. When you have completed the assignment, **Knit** the text and code into a single PDF file.
- 5. After Knitting, submit the completed exercise (PDF file) to the dropbox in Sakai. Add your last name into the file name (e.g., "Salk_A06_GLMs_Week1.Rmd") prior to submission.

The completed exercise is due on Tuesday, February 25 at 1:00 pm.

Set up your session

library(piecewiseSEM)

- 1. Set up your session. Check your working directory, load the tidyverse, nlme, and piecewiseSEM packages, import the raw NTL-LTER raw data file for chemistry/physics, and import the processed litter dataset. You will not work with dates, so no need to format your date columns this time.

```
2. Build a ggplot theme and set it as your default theme.
getwd()

NTL-LTER test

Research question: What is the best set of predictors for lake temperatures in July across the monitoring period at the North Temperate Lakes LTER?

- 3. Wrangle your NTL-LTER dataset with a pipe function so that it contains only the following criteria:
- Only dates in July (hint: use the daynum column). No need to consider leap years.
- Only the columns: lakename, year4, daynum, depth, temperature_C
- Only complete cases (i.e., remove NAs)
- 4. Run an AIC to determine what set of explanatory variables (year4, daynum, depth) is best suited to predict temperature. Run a multiple regression on the recommended set of variables.

```
## Start: AIC=26016.31
## temperature_C ~ year4 + daynum + depth
##
##
            Df Sum of Sq
                            RSS
                                   AIC
## <none>
                         141118 26016
## - year4
                      80 141198 26020
             1
## - daynum 1
                    1333 142450 26106
## - depth
             1
                  403925 545042 39151
##
## Call:

  5. What is the final set of explanatory variables that predict temperature from your multiple regression?
```

How much of the observed variance does this model explain?

Answer: Year, Day number and depth are the final set of explanatory variables that predict temperature. The model explains 74% of the observed variance.

6. Run an interaction effects ANCOVA to predict temperature based on depth and lakename from the same wrangled dataset.

```
#6
Tempancova.interaction <- lm(data = NTL.chem.July, temperature_C ~ lakename * depth)
summary(Tempancova.interaction)

```

7. Is there a significant interaction between depth and lakename? How much variance in the temperature observations does this explain?

Answer: There is a significant interaction between depth and lake name. This model explained 79% of variance in temperature.

8. Create a graph that depicts temperature by depth, with a separate color for each lake. Add a geom_smooth (method = "lm", se = FALSE) for each lake. Make your points 50 % transparent. Adjust your y axis limits to go from 0 to 35 degrees. Clean up your graph to make it pretty.

```
Tempplot <- ggplot(data = NTL.chem.July, aes(x = depth, y = temperature_C, color = lakename)) +
   geom_point(alpha = 0.5, size = 0.75) +
   geom_smooth(method = "lm", se = FALSE) +
   ylim(0, 35)+
   labs(x = "Depth (m)", y = expression("Temperature " ( degree~C)), color = "")+
   scale_color_viridis_d()
print(Tempplot)</pre>
```

Warning: Removed 73 rows containing missing values (geom_smooth).

 Crampton Lake
 Hummingbird Lake
 Peter Lake
 Ward Lake
- O entradue 10 Depth (m)
 - 9. Run a mixed effects model to predict dry mass of litter. We already know that nlcdClass and functionalGroup have a significant interaction, so we will specify those two variables as fixed effects with an interaction. We also know that litter mass varies across plot ID, but we are less interested in the actual effect of the plot itself but rather in accounting for the variance among plots. Plot ID will be our random effect.
 - a. Build and run a mixed effects model.
 - b. Check the difference between the marginal and conditional R2 of the model.

```
litter.mixed <- lme(data = Litter,</pre>
                      dryMass ~ nlcdClass * functionalGroup,
                      random = ~1|plotID)

  b. continued... How much more variance is explained by adding the random effect to the model?
    Answer: 2 % (difference between conditional and marginal R2)
  c. Run the same model without the random effect.
  d. Run an anova on the two tests.

d. continued... Is the mixed effects model a better model than the fixed effects model? How do you know?

Answer: Yes, the mixed effects model is a better model than the fixed effects model. This is apparent because the AIC for the mixed effect model is lower than the AIC for the fixed effects model. Additionally, the p-value <.0001, which indicates there is a significant difference between the models.
